*Chemical Synthesis* is an open access peer-reviewed journal publishing original research from across all areas of the chemical sciences. The journal aims to be the premier resource of seminal and insightful research as well as a showcase for researchers in both academia and industry, providing a platform of inspiration for the future of chemistry. *Chemical Synthesis* intends to serve as the preeminent international chemistry journal and has the ambition to be among the first choices of chemists for publication of their discoveries.

Chemical synthesis is a series of chemical reactions for the purpose of obtaining one or more known or unknown substances or materials. It is the foundation and core of organic chemistry, inorganic chemistry, medicinal chemistry, polymer chemistry, and materials chemistry. Inorganic synthesis provides a bright prospect for the development of inorganic materials. New inorganic materials have been widely used in various fields of economy, such as high temperature resistance, high pressure resistance, low temperature resistance, optics, electricity, magnetism, superconductivity, energy storage and conversion materials, etc., as well as catalytic materials that promote the development of petrochemicals. The new materials provided by synthetic chemistry enable the further development of space technology, atomic energy industry, and marine resource development. Synthetic chemistry provides many new ways to produce drugs, synthesizing sulfonamides, antibiotics, vitamins, and oral contraceptives. Many analgesics, anesthetics, preservatives, hypnotic agents, etc. are now synthesized. The close cooperation of synthetic chemistry, biology, physics, and other disciplines is expected to play an important role in conquering diseases such as cancer and mental illness, controlling heredity, and extending human life.
In short, synthetic chemistry can not only imitate substances found in nature, but also create substances that do not exist in nature, which play a very important role in the development of science and technology and the progress of humanity.

Chemical Synthesis will thus embrace all significant advances in chemical synthesis, theoretical and instrumental studies at the molecular and nano level, and the application of synthetic products (materials), encompassing the previously unknown and the innovative.

Chemical Synthesis is led by a team of globally well-known and enthusiastic editors who are very active in their respective fields and possess editorial experience.

DECLARATIONS

Authors’ contributions
The author contributed solely to the article.

Availability of data and materials
Not applicable.

Financial support and sponsorship
None.

Conflicts of interest
The author declared that there are no conflicts of interest.

Ethical approval and consent to participate
Not applicable.

Consent for publication
Not applicable.
