## 25 **EXPERIMENTAL**

### 26 **Materials and catalyst preparation**

27 The self-supported electrode was synthesized through a facial hydrothermal  
28 self-assembly process and a calcination treatment. In a typical synthesis, 0.79 g  
29  $\text{KMnO}_4$  and 2 mL HCl (36 wt%) were added to 50 mL deionized (D.I.) water to form  
30 a precursor solution. Then the mixture was transferred into a 100 mL Teflon-lined  
31 stainless steel autoclave. The hydrothermal reaction was carried out at 140 °C for 12  
32 hours. After that the  $\text{MnO}_2$  nanotubes was collected by centrifugation and washed  
33 with ethanol and D.I. water before vacuum-drying. The hybrid  
34  $\text{NiCo}_2\text{O}_4@\text{MnO}_2/\text{CNTs}$ -Ni foam electrode was prepared by dissolving 0.250 g cobalt  
35 (II) acetate tetrahydrate and 0.250 g nickel acetate tetrahydrate in 30 mL (25-28 wt%)  
36 ammonia solution. Then, 0.2 g of as-prepared  $\text{MnO}_2$  and 0.02 g CNTs were added to  
37 the above solution, with 0.5 h ultrasonic condition to form a uniform solution. Ni  
38 foam (2 cm x 2 cm) was cleaned under ultrasonication for every 30 min with D.I.  
39 water, 0.1M HCl and ethanol in order to remove the oxidized surface layer. Then the  
40 mixture solution and the preprocessed Ni foam were moved into a 100 mL autoclave  
41 and maintaining 160 °C for 6 h. The self-supporting electrode and resulting product  
42 were separated and washed with D.I. water. After that drying in a vacuum oven at  
43 70 °C for 8 h. Finally, the resulting product and self-supporting electrode were further  
44 calcined in air at 350 °C for 1 h to obtain the target samples.

### 45 **Physical characterizations of self-supporting air cathode**

46 The morphologies of catalyst and electrode samples were assessed by an S-4800  
47 field-emission scanning electron microscope (SEM). Transmission electron  
48 microscopy (TEM) evaluation were performed with a high-resolution Talos F200S to  
49 get information of the the dispersion and the particle size of the catalyst at 200 kV  
50 operating voltage. X-ray diffraction (XRD, Bruker D8 ADVANCE) was performed to  
51 analyze the crystallite phase and structure of the obtained samples over the  $2\theta$  range  
52 from 10° to 90°. X-ray photoelectron spectroscopy (XPS, Escalab 250Xi) was carried  
53 out to characterize the chemical states and the compositions of samples.

## 54 **Electrode Preparation and Electrochemical Measurements**

55 OER and ORR catalytic performance of the as-prepared catalyst powder samples and  
56 a self-supporting electrode were tested by the rotating disc electrode (RDE). Nafion as  
57 a binder impregnated in the catalyst ink and help the catalyst to be loaded on a glassy  
58 carbon disk electrode.

59 During the preparation of the powder catalyst ink, 10 mg of the as-prepared catalyst  
60 was added into 2 mL ethanol with 16  $\mu\text{L}$  5 wt% Nafion mixture solution. Form a  
61 well-dispersed catalyst ink by sonication. In the test, 16  $\mu\text{L}$  of the catalyst ink was  
62 dropped onto the glassy carbon disk electrode. The catalyst loading content was  
63 controlled in 2  $\text{mg cm}^{-2}$ . The self-supporting electrode was prepared as 1 cm x 1 cm  
64 size in the half-cell test. Electrochemical activity of the samples was studied using a  
65 linear sweep voltammetry (LSV). In the measurements, the glassy carbon disk  
66 electrode coating the catalyst was submerged in a five-port electrolytic cell containing  
67 0.1 M KOH aqueous electrolyte, in which a platinum foil and a saturated calomel  
68 electrode (SCE) were used as the counter and reference electrodes, respectively. Then,  
69 LSV was performed with a potential range of 0.2V - 1.0 V vs reversible hydrogen  
70 electrode (RHE,  $\varphi(\text{RHE})=\varphi(\text{SCE})+0.24\text{V}+0.0591*\text{pH}$ ) for ORR at 5  $\text{mV s}^{-1}$  and a  
71 rotation rate of 400, 625, 900, 1225, and 1600 rpm and a potential range of 1.0 V - 2  
72 V vs RHE for OER at 5  $\text{mV s}^{-1}$  and a rotation rate of 1600 rpm. The transferred  
73 electron number of ORR was calculated from the slopes of Koutecky–Levich (K–L)  
74 plots<sup>26</sup>. A commercial Pt/C-RuO<sub>2</sub> catalyst was used as the comparative sample and  
75 tested using the same procedure as that for the self-supporting electrode except no  
76 rotating speed.

## 77 **Performance measurements of ZABs**

78 A rechargeable ZAB contains the following parts an air electrode (4 cm x 4 cm)  
79 loading 1  $\text{cm}^2$  catalyst and the NiCo<sub>2</sub>O<sub>4</sub>@MnO<sub>2</sub>/CNTs-Ni foam self-supporting  
80 electrode were used as the air cathode. Zinc plate was used as the anode. 6 M KOH  
81 worked as the flowing electrolyte in the zinc-air battery. Power density plots were  
82 measured by galvanodynamic method. The rate capability of the ZAB assessed by

83 analyzing the galvanostatic discharge curves at different current densities from 5 to 30  
84 mA cm<sup>-2</sup>, with a growth rate of 5 mA cm<sup>-2</sup>. The long-term stability of the ZAB was  
85 tested by constant current charge and discharge at 5 mA cm<sup>-2</sup>, 20 min per cycle.

110 **Table S1.** The power density and voltage gaps are compared with several different  
 111 types of MnO<sub>2</sub> and transition metal supported MnO<sub>2</sub>.

Catalyst	Voltage gaps	Power density (mW cm <sup>2</sup> )	Reference s
NiCo <sub>2</sub> O <sub>4</sub> @CNTs	0.87 V@2 mA cm <sup>-2</sup>	160	[1]
Co <sub>3</sub> O <sub>4</sub> /MnO <sub>2</sub>	NA	43	[2]
NiCo <sub>2</sub> O <sub>4</sub> -rGO	0.70 V@5 mA mA cm <sup>-2</sup>	125.3	[3]
α-MnO <sub>2</sub>	0.8 V@10 mA mA cm <sup>-2</sup>	140	[4]
α-MnO <sub>2</sub>	0.85 V@10 mA mA cm <sup>-2</sup>	166	[5]
MnO <sub>2</sub> /CNTs	0.875 V@5 mA mA cm <sup>-2</sup>	40.5	[6]
NiCo <sub>2</sub> O <sub>4</sub> @MnO <sub>2</sub> -CNTs	0.8 V@20 mA mA cm <sup>-2</sup>	255	[7]
NiCo <sub>2</sub> O <sub>4</sub> -CN	1.03 V@10 mA mA cm <sup>-2</sup>	149.6	[8]
NiCo <sub>2</sub> O <sub>4</sub> @MnO <sub>2</sub> /CNTs-Ni foam	0.69 V@5mA mA cm <sup>-2</sup>	225	This work
