**Figure S1.** Ortep drawing of the asymmetric unit in the crystal structure of Pt<sub>8</sub>Ag<sub>4</sub>-MOCs (at 30% probability).

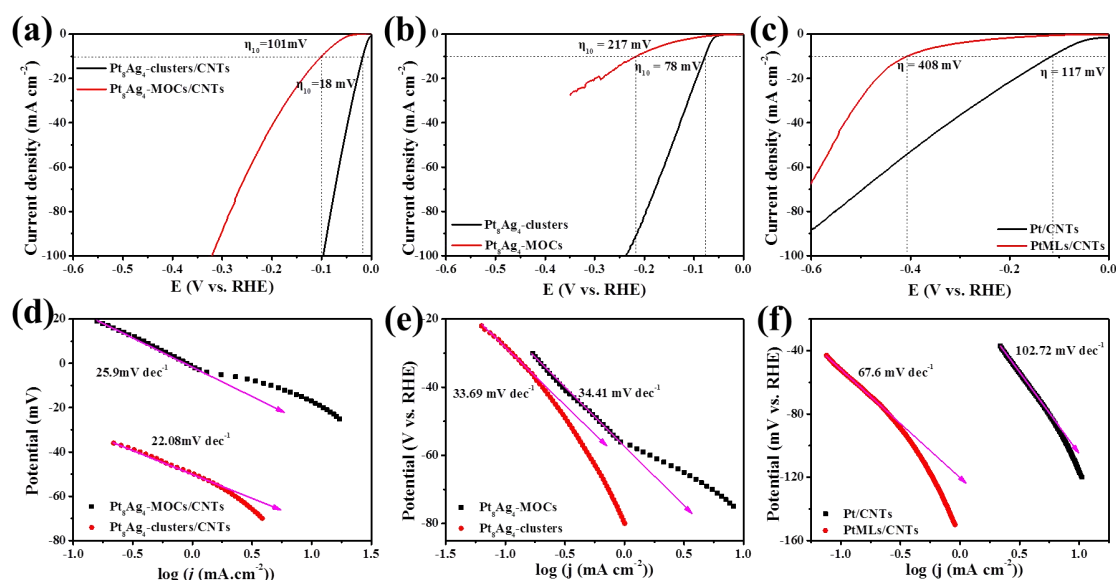

**Figure S2.** XRD patterns of Pt<sub>8</sub>Ag<sub>4</sub>-MOCs/CNTs, Pt<sub>8</sub>Ag<sub>4</sub>-clusters/CNTs and Pt/CNTs.

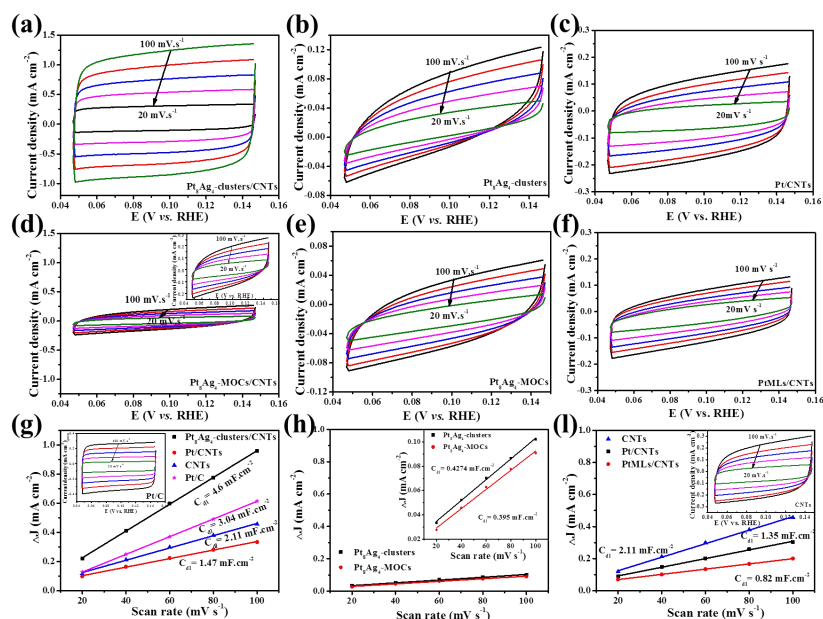

**Figure S3.** (a) XANES and (b) EXAFS spectra of Pt<sub>8</sub>Ag<sub>4</sub>-clusters/CNTs, Pt/CNTs, Pt<sub>8</sub>Ag<sub>4</sub>-MOCs/CNTs, PtAg alloy, PtO<sub>2</sub>, Pt foil, Ag<sub>2</sub>O and Ag foil.

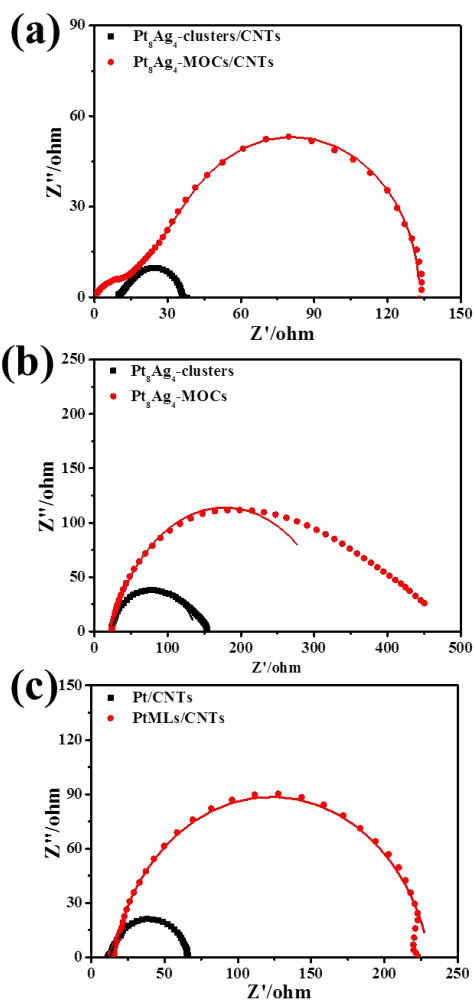

**Figure S4.** XPS of  $\text{Pt}_8\text{Ag}_4$ -clusters/CNTs,  $\text{Pt}_8\text{Ag}_4$ -MOCs/CNTs and Pt/CNTs.

**Figure S5.** LSV of  $\text{Pt}_8\text{Ag}_4$ -clusters/CNTs and  $\text{Pt}_8\text{Ag}_4$ -MOCs/CNTs (a);  $\text{Pt}_8\text{Ag}_4$ -clusters and  $\text{Pt}_8\text{Ag}_4$ -MOCs (b); Pt/CNTs and PtMLs/CNTs (c) for HER with a sweep rate of  $5 \text{ mV s}^{-1}$  in  $0.5 \text{ M H}_2\text{SO}_4$  solution. The Tafel slopes of  $\text{Pt}_8\text{Ag}_4$ -clusters/CNT, and  $\text{Pt}_8\text{Ag}_4$ -MOCs/CNTs (d);  $\text{Pt}_8\text{Ag}_4$ -clusters and  $\text{Pt}_8\text{Ag}_4$ -MOCs (e); Pt/CNTs and PtMLs/CNTs (f).

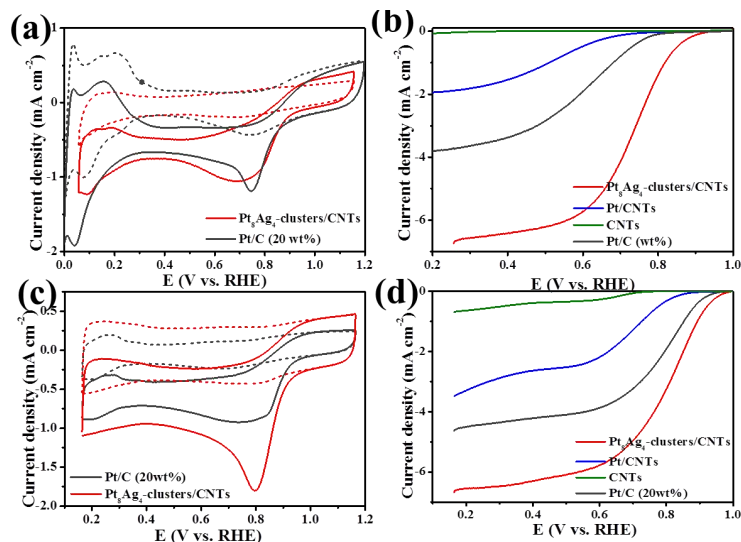

**Figure S6.** (a-f) The CVs of Pt<sub>8</sub>Ag<sub>4</sub>-clusters/CNTs, Pt<sub>8</sub>Ag<sub>4</sub>-MOCs/CNTs, Pt<sub>8</sub>Ag<sub>4</sub>-clusters, Pt<sub>8</sub>Ag<sub>4</sub>-MOCs, Pt/CNTs and PtMLs/CNTs with a sweep rate of 5 mV s<sup>-1</sup> in 0.5M H<sub>2</sub>SO<sub>4</sub> solution, respectively (The inset in (d) displays the enlarged view of (d)). The  $\Delta J$  of Pt<sub>8</sub>Ag<sub>4</sub>-clusters/CNTs, Pt<sub>8</sub>Ag<sub>4</sub>-MOC/CNTs and CNTs (g); Pt<sub>8</sub>Ag<sub>4</sub>-clusters and Pt<sub>8</sub>Ag<sub>4</sub>-MOCs (h); Pt/CNTs, PtMLs/CNTs and CNTs (i) plotted against scan rate to the potential of 0.97 V vs. RHE (The inset in (i) displays the CVs of CNTs).

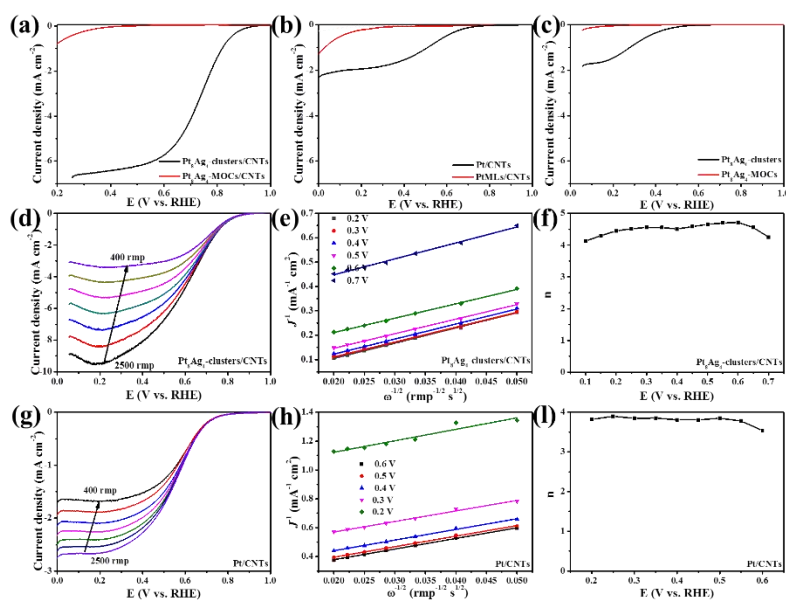

**Figure S7.** EIS of Pt<sub>8</sub>Ag<sub>4</sub>-clusters/CNTs and Pt<sub>8</sub>Ag<sub>4</sub>-MOCs/CNTs (a); Pt<sub>8</sub>Ag<sub>4</sub>-clusters and Pt<sub>8</sub>Ag<sub>4</sub>-MOCs (b); Pt/CNTs and PtMLs/CNTs (c) in 0.5 M H<sub>2</sub>SO<sub>4</sub> solution at the current density of 10 mA cm<sup>-2</sup>, respectively.

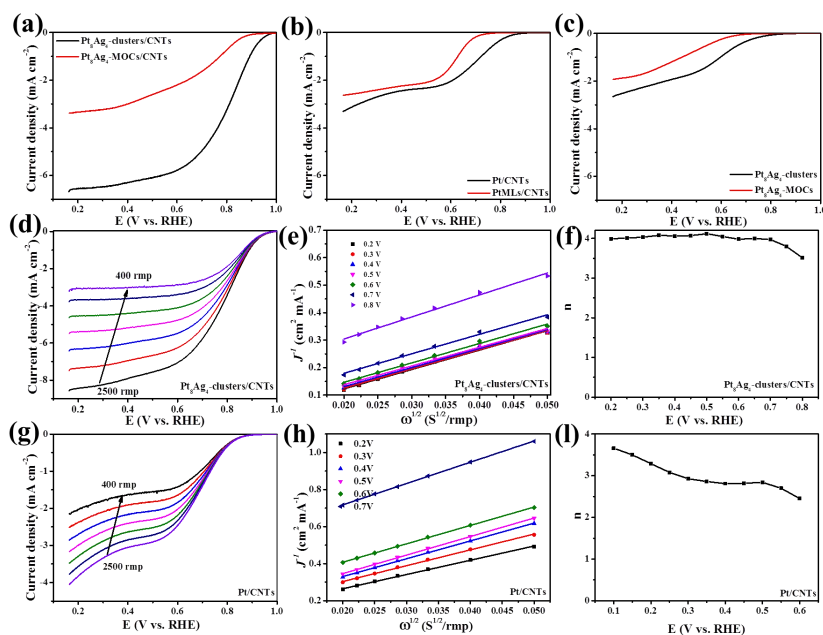

**Figure S8.** (a) LSV polarization curves of HER at a scan rate of  $5 \text{ mV s}^{-1}$ ; (b) Tafel plots  $\text{Pt}_8\text{Ag}_4$ -clusters/CNTs, Pt/CNTs, CNTs and commercial Pt/C in 1 M KOH solution respectively. (c) LSV polarization curves of HER at a scan rate of  $5 \text{ mV s}^{-1}$ ; (d) Tafel plot of  $\text{Pt}_8\text{Ag}_4$ -clusters/CNTs, Pt/CNTs and commercial Pt/C in 1M PBS solution respectively.

**Figure S9.** (a) CV curves of  $\text{Pt}_8\text{Ag}_4$ -clusters/CNTs and Pt/C in  $\text{O}_2$  or  $\text{N}_2$ -saturated in 0.1 M KOH solution at a scan rate of  $50 \text{ mV s}^{-1}$ ; (b) the LSV curves of CNTs,  $\text{Pt}_8\text{Ag}_4$ -clusters,  $\text{Pt}_8\text{Ag}_4$ -clusters/CNTs and Pt/C in  $\text{O}_2$  saturated 0.1M KOH solution at a scan rate of  $5 \text{ mV s}^{-1}$  respectively.

**Figure S10.** (a-c) RDE polarization curves of Pt<sub>8</sub>Ag<sub>4</sub>-clusters/CNTs, Pt<sub>8</sub>Ag<sub>4</sub>-MOCs/CNTs, P Pt<sub>8</sub>Ag<sub>4</sub>-clusters, Pt<sub>8</sub>Ag<sub>4</sub>-MOCs, Pt/CNTs and PtMLs/CNTs for ORR with a sweep rate of 5 mV s<sup>-1</sup> at 1600 rpm; (d) and (g) RDE polarization curves of Pt<sub>8</sub>Ag<sub>4</sub>-clusters/CNTs and Pt/CNTs at different rotation rates; (e) and (h) the K-L plots of Pt<sub>8</sub>Ag<sub>4</sub>-clusters/CNTs and Pt/CNTs; (f) and (i) the electron transfer numbers of Pt<sub>8</sub>Ag<sub>4</sub>-clusters/CNTs and Pt/CNTs based the corresponding K-L plots in O<sub>2</sub>-saturated 0.5M H<sub>2</sub>SO<sub>4</sub> solution, respectively.

**Figure S11.** (a-c) RDE polarization curves of Pt<sub>8</sub>Ag<sub>4</sub>-clusters/CNTs, Pt<sub>8</sub>Ag<sub>4</sub>-MOCs/CNTs, Pt<sub>8</sub>Ag<sub>4</sub>-clusters, Pt<sub>8</sub>Ag<sub>4</sub>-MOCs, Pt/CNTs and PtMLs/CNTs for ORR with a sweep rate of 5mV s<sup>-1</sup> and 1600rpm; (d) and (g) RDE polarization curves of Pt<sub>8</sub>Ag<sub>4</sub>-clusters/CNTs and Pt/CNTs at different rotation rates; (e) and (h) the K-L plots of Pt<sub>8</sub>Ag<sub>4</sub>-clusters/CNTs and Pt/CNTs; (f) and (i) the electron transfer numbers of Pt<sub>8</sub>Ag<sub>4</sub>-clusters/CNTs and Pt/CNTs based the corresponding K-L plots in O<sub>2</sub>-saturated 0.1 KOH solution, respectively.

**Figure S12.** Top (a) and side (b) view of the model of Pt<sub>8</sub>Ag<sub>4</sub>/CNT and top (c) and side (d) view of the model of Pt/CNT which were used for calculation of HER and ORR. Dark blue, sky blue and grey atoms represent Pt, Ag and C, respectively.

**Figure S13.** Top (a) and side (b) view of the model of Pt<sub>8</sub>Ag<sub>4</sub>/CNT and the H atom at the Ag site; Top (c) and side (d) view of the model of Pt<sub>8</sub>Ag<sub>4</sub>/CNT and the H atom at

the Pt site. Dark blue, sky blue, grey and white atoms represent Pt, Ag, C and H, respectively.

**Figure S14.** Top (a) and side (b) view of the model of Pt/CNT and the H atom at the top site; and top (c) and side (d) view of the model of Pt/CNT and the H atom at bridge site. Dark blue, sky blue, grey and white atoms represent Pt, Ag, C and H, respectively.

**Figure S15.** Top (a) and side (b) view of the model of Pt<sub>8</sub>Ag<sub>4</sub>/CNT; and top (c) and side (d) view of the model of Pt/CNT and the O atom adsorbed at the optimum site. Dark blue, sky blue, grey and red atoms represent Pt, Ag, C and O, respectively.

**Figure S16.** <sup>1</sup>H NMR spectrum of Pt metalloligand (400 MHz, CDCl<sub>3</sub>, 298 K).

**Figure S17.** <sup>1</sup>H COSY spectrum of Pt metalloligand (400 MHz, CDCl<sub>3</sub>, 298 K).

**Figure S18.**  $^{13}\text{C}$  NMR spectrum of Pt metalloligand (100 MHz,  $\text{CDCl}_3$ , 298 K).

**Table S1** ICP-MS comparison of  $\text{Pt}_8\text{Ag}_4$ -clusters/CNTs and Pt/CNTs nanostructures.

| Samples                                 | Pt ( $\text{mg L}^{-1}$ ) | Ag( $\text{mg L}^{-1}$ ) |
|---|---------------------------|--------------------------|
| $\text{Pt}_8\text{Ag}_4$ -clusters/CNTs | 96.63                     | 23.49                    |
| Pt/CNTs                                 | 163.22                    | -                        |

**Table S2.** Pt  $L_3$ -edge white line.

| Samples                                  | $E_0$ (eV) | $E_{\text{peak}}$ (eV) | $\Delta A$ |
|--|------------|------------------------|------------|
| Pt foil                                  | 111564     | 11565.50               | 6.78       |
| Pt/CNTs                                  | 11564.58   | 11567.19               | 6.81       |
| $\text{Pt}_8\text{Ag}_4$ -clusters /CNTs | 11564.97   | 11567.06               | 6.81       |
| PtAg-MOCs/CNTs                           | 11565.50   | 11568.54               | 6.82       |
| PtAg alloy                               | 11563.98   | 11562.12               | 8.04       |

## EXPERIMENTAL PROCEDURES

### 1. Materials

All chemicals and solvents were purchased from Adamas Reagent, Ltd and used without further purification. Anhydrous solvents were distilled according to standard procedures.

**Table S10.** The details of all Chemicals and solutions.

| <b>Chemicals and solvents</b>      | <b>Purity(%)</b> | <b>commercial company</b> |
|------------------------------------|------------------|---------------------------|
| dipotassiumtetrachloroplatinate    | 98               | Adamas                    |
| 2,2'-bipyridine                    | 99               | Adamas                    |
| 4-ethynylpyridine<br>hydrochloride | 98               | Adamas                    |
| Copper(I) Iodide                   | 99               | Adamas                    |
| 4-ethynylpyridine                  | 98               | Adamas                    |

## 2. Synthesis and characterization of materials

### Preparation of Pt metalloligand, Pt-MLs/CNTs and Pt/CNTs

The Pt metalloligand (Scheme S1) was synthesized from standard CuI-catalyzed coupling reactions between the (bpy)PtCl<sub>2</sub> precursor (bpy=2,2'-bipyridine) and 4-ethynylpyridine in the presence of triethylamine in dichloromethane at room temperature, according to the literature protocol. [1] <sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>) δ 9.72 (d, J = 5.4 Hz, 2H), 8.47 (d, J = 5.6 Hz, 4H), 8.20 (t, J = 7.8 Hz, 2H), 8.12 (d, J = 8.0 Hz, 2H), 7.67 (t, J = 6.6 Hz, 2H), 7.35 (d, J = 5.5 Hz, 4H). <sup>13</sup>C NMR (100 MHz, CDCl<sub>3</sub>) δ 156.25, 151.85, 149.24, 139.29, 136.01, 127.92, 126.70, 122.53, 100.52. (Figure S16-18)

**Scheme S1.** Synthetic route of Pt metalloligands.

The Pt metalloligand (5 mg) and carbon nanotubes (CNTs, 15 mg) were dissolved in 8 mL of mixed solution [0.48 mL of Nafion (5%), 1.6 mL of ethanol and 5.92 mL of deionized water]. The suspension system was evenly mixed by ultrasonication treatment for 1 h to obtain the stock solution of PtMLs/CNTs.

6.0 μL of the above PtMLs/CNTs stock solution is dripped onto the glassy carbon electrode or rotating disk electrode, and dried by infrared lamp. Then the electrochemical reduction was carried out in sulfuric acid solution (0.5 M) at the voltage of -0.5 V (vs. Ag/AgCl) to prepare the Pt/CNTs for the control experiment.

### Preparation of Pt<sub>8</sub>Ag<sub>4</sub>-MOCs, Pt<sub>8</sub>Ag<sub>4</sub>-MOCs/CNTs and Pt<sub>8</sub>Ag<sub>4</sub>-clusters/CNTs.

2 mL of Pt metalloligand (3.3 mg, 0.006 mM) in DCM was added into a glass tube, and 0.5 mL of mixed DCM/CH<sub>3</sub>OH solvent (v/v=10/1) was added onto it, then 2 mL of AgBF<sub>4</sub> (0.6 mg, 0.003 mM) in methanol was dropped on the above solvent slowly.

After a week reaction in dark, orange crystals of Pt<sub>8</sub>Ag<sub>4</sub>-MOCs were produced (1.17 mg, 30% yield).

5.0 mg of PtAg-MOCs was dispersed in 8 mL of a mixed solution [0.48 mL of Nafion (5%), 1.6 mL of ethanol and 5.92 mL of deionized water]. The suspension was evenly mixed by ultrasonication treatment to prepare the stock solution of Pt<sub>8</sub>Ag<sub>4</sub>-MOCs/CNTs.

6.0 μL of the Pt<sub>8</sub>Ag<sub>4</sub>-MOCs/CNTs stock solution was dropped onto the glassy carbon electrode or rotating disk electrode, and dried by infrared lamp. Then the electrochemical reduction was carried out in sulfuric acid solution (0.5 M) at the voltage of -0.5 V (vs. Ag/AgCl) to prepare Pt<sub>8</sub>Ag<sub>4</sub>-clusters/CNTs.

**Materials characterization:** The X-ray diffraction (XRD) studies were carried out on Bruker D8 VENTURE photon II diffractometer with I $\mu$ s 3.0 microfocus X-ray source using APEX III program. [2] Data reduction was performed with the saint and SADABS package. The structure was solved by direct method and refined by full-matrix least-squares on F<sup>2</sup> with anisotropic displacement using the SHELX software package. [3] Solvent molecules were highly disordered and could not be reasonably located. These residual intensities were removed by a PLATON/SQUEEZE routine. [4]

---

The transmission electron microscopy (TEM) and high resolution transmission electron microscopy (HRTEM) images were measured in a JEOL model JEM 2010 EX instrument at an accelerating voltage of 200 kV. The powder was supported on a carbon film coated on a fine-mesh copper grid (3 mm in diameter). The sample suspension in ethanol was sonicated and a drop was dripped on the support film. X-ray photoelectron spectroscopy (XPS) measurements were performed on a PHI Quantum 2000 XPS system (PHI, USA) with a monochromatic Al K $\alpha$  source and a charge neutralizer. All the binding energy is reference to C 1s peak observed in the XPS spectrum of pure porous carbon.

**X-ray absorption fine structure (XAFS) measurements:** XAFS data of Pt L<sub>3</sub>-edge were collected at BL14W1 station in SSRF and 1W1B station in BSRF. The storage rings of SSRF and BSRF were operated at 3.5 GeV with the current of 300 mA and at 2.5 GeV with the current of 250 mA respectively. The XAFS data were recorded in a transmission mode and then were processed according to the standard procedures using ATHENA module implemented in the IFEFFIT software packages. The L<sub>3</sub>-weighted EXAFS spectra were obtained by subtracting the post-edge background

from the overall absorption and normalizing with respect to the edge-jump step. Subsequently, by using a hanning windows ( $dk=1.0\text{\AA}^{-1}$ ),  $L_3$ -weighted  $\chi(k)$  data in the  $k$ -space ranging from  $2.4\text{-}14.0\text{ \AA}^{-1}$  were Fourier transformed to real (R) space that separate the EXAFS contribution from different coordination shells.

### 3. Electrochemical measurements

Electrochemical measurements were conducted at room temperature ( $25\text{ }^\circ\text{C}$ ) on a CHI760E electrochemical workstation (CH instrument Co.) in a three-electrode cell. The carbon electrode and an Ag/AgCl electrode (saturated KCl) are used as the counter electrode and reference electrode, respectively. A glassy carbon electrode (GC) and rotating disk electrode (RDE) with a glassy carbon disk ( $3.0\text{ mm}$  diameter) served as the substrate for the working electrode. Experimentally, for Pt/C (20 wt%) sample,  $2.5\text{ mg}$  of the commercial Pt/C and  $7.5\text{ mg}$  of MWCNTs were ultrasonically dispersed in a solution ( $8\text{ mL}$ ) containing  $0.05\text{wt}\%$  of Nafion ( $480\text{ }\mu\text{L}$ ) and ethanol ( $1600\text{ }\mu\text{L}$ ) for  $60\text{ min}$  to form a concentration of  $1.25\text{ mg mL}^{-1}$  catalyst ink. The volumes of catalyst ink were  $6\text{ }\mu\text{L}$  for the GC and RDE tests in acid, neutral and alkaline conditions.

The ECSA of a catalyst sample is calculated based on the double layer capacitance according to **Eq. 1**:

$$ECSA = C_{dl}/C_s \quad (Eq.1)$$

where  $C_s$  is the specific capacitance of the sample or the capacitance of an atomically smooth planar surface of the material per unit area in the same electrolyte. For our studying, we use general specific capacitances of  $C_s = 0.035\text{ mF cm}^{-2}$  in  $\text{H}_2\text{SO}_4$  based on typical reported values.<sup>[5]</sup>

The oxygen reduction reaction test is as follows. In alkaline conditions, the RDE tests were carried out in an  $\text{O}_2$ -saturated  $0.1\text{ M KOH}$  solution. In acidic condition, the RDE tests were carried out in an  $\text{O}_2$ -saturated  $0.5\text{ M H}_2\text{SO}_4$  solution. The scan rate was  $50\text{ mV s}^{-1}$  for CV measurements and  $5\text{ mV s}^{-1}$  for the RDE tests.

The electrocatalysis studies for hydrogen evolution reaction test are conducted as follows. In alkaline conditions, the GC tests were carried out in  $1\text{ M KOH}$  solution. In neutral condition, the GC tests were carried out in  $1\text{ M PBS}$  solution. In acidic condition, the GC tests were carried out in  $0.5\text{ M H}_2\text{SO}_4$  solution. The scan rate was  $50\text{ mV s}^{-1}$  for CV measurements and  $5\text{ mV s}^{-1}$  for the RDE tests.

All the potentials in this study were calibrated with a reversible hydrogen electrode (RHE), and the potential conversion formula as following: [6-7]

$$E_{RHE} = E_{Ag/AgCl} + 0.0591 \text{ V} \times \text{pH (at 25 } ^\circ\text{C)}$$

(Eq.2)

For the RDE tests, the polarization curves were collected at disk rotation from  $-1.0$  V to  $+0.2$ . The polarization curves were carried out at a scan rate of  $5 \text{ mV s}^{-1}$  at different rotation rates ranging from 400 to 2500 rpm. The limited diffusion currents ( $J_K$ ) and the electron transfer number ( $n$ ) can be obtained according to the *K-L* plots which based on the Koutecky-Levich (*K-L*) equations [Eq. (3-5)]:

$$1/J = 1/J_L + 1/J_K = 1/(BW^{1/2}) + 1/J_K$$

(Eq.3)

$$B = 0.2nFC_0(D_0)^{2/3}\nu^{-1/6}$$

(Eq.4)

$$J_K = 1/(nkFC_0)$$

(Eq.5)

The constant 0.2 is adopted when the rotation rate is expressed in rpm. For the Tafel plot, the kinetic current was calculated from the mass-transport correction of RDE by:

$$J_K = (J_L * J)/(J_L - J) \quad (\text{Eq.6})$$

where  $J$  represents the measured current density;  $J_K$  and  $J_L$  are the kinetic- and diffusion-limiting current densities, respectively;  $w$  is the linear rotation speed ( $\text{rpm s}^{-1}$ ) of the disk;  $F$  is the Faraday constant ( $F=96485 \text{ C mol}^{-1}$ ),  $C_0$  is the bulk concentration of  $\text{O}_2$  ( $C_0=1.2*10^{-6} \text{ mol cm}^{-3}$ ),  $D_0$  is the diffusion coefficient of  $\text{O}_2$  in 0.1M KOH solution ( $D_0=1.9*10^{-5} \text{ cm}^2/\text{s}$ ),  $\nu$  is the kinematic viscosity of the electrolyte ( $\nu=0.01 \text{ cm}^2 \text{ s}^{-1}$ ), and  $k$  is the electron-transfer rate constant.

The stability test was performed at a static potential at room temperature with the working electrode rotating at 1600 rmp in  $\text{O}_2$ -saturated solution for ORR studying. The stability test was performed at a static potential (0.24 V vs Ag/AgCl) at room temperature for HER and the chronomperometry test was performed at a static current density ( $10 \text{ mA cm}^{-2}$ ) in 0.5 M  $\text{H}_2\text{SO}_4$  solution.

The TOF ( $\text{s}^{-1}$ ) can be calculated with the following equation: [8]

$$\text{TOF} = I/(2Fn_0)$$

(Eq.7)

Q is the voltannmentric charge; F is the Faraday constant ( $96485 \text{ mol}^{-1}$ ); I is the current (A) during the linear sweep measurement;  $n_a$  is the number of active sites (mol).

#### **4. The Calculation Method of Density Functional Theory (DFT) Calculation Method**

DFT calculations were performed with periodic super-cells under the generalized gradient approximation (GGA) using the Perdew-Burke-Ernzerhof (PBE) function for exchange-correlation and the ultrasoft pseudopotentials for nuclei and core electrons. The Kohn-Sham orbitals were expanded in a plane-wave basis set with a kinetic energy cutoff of 30 Ry and the charge-density cutoff of 300 Ry. The Fermi-surface effects have been treated by the smearing technique of Methfessel and Paxton, using a smearing parameter of 0.02 Ry. The Brillouin-zones were sampled with a k-point mesh of  $3 \times 3 \times 1$ . The vacuum layer was  $\sim 15 \text{ \AA}$  to remove the slab interaction between the z direction. The models of Pt<sub>8</sub>Ag<sub>4</sub>/CNT and Pt/CNT have been relaxed before calculated to optimize the structure. The DFT calculations are given by the PW module contained in the Quantum ESPRESSO distribution.<sup>[9]</sup>
