I: General Information

Chemicals were purchased as reagent grade and used without further purification. Solvents (THF, toluene) were distilled from appropriate drying agents prior to use. In addition, more solvents were purchased from commercial suppliers and dried over molecular sieves. Proton nuclear magnetic resonance (^1H NMR) spectra were recorded on a Bruker (400 MHz) spectrometer. Chemical shifts were recorded in parts per million (ppm, δ) relative to tetramethylsilane (δ 0.00) or chloroform (δ = 7.26, singlet). ^1H NMR splitting patterns are designated as singlet (s), doublet (d), triplet (t), quartet (q), dd (doublet of doublets); m (multiplets), and etc. All first-order splitting patterns were assigned on the basis of the appearance of the multiplet. Splitting patterns that could not be easily interpreted are designated as multiplet (m) or broad (br). Carbon nuclear magnetic resonance (^{13}C NMR) spectra were recorded on a Bruker (400 MHz) (100 MHz) spectrometer. Fourier transform infrared spectroscopy (FT-IR, a Bruker model VECTOR-22 Fourier transform spectrometer). High resolution mass spectral analysis (HRMS) was performed on a Waters Q-TOF Permier Spectrometer. X-ray crystallography analysis was performed on Bruker X8 APEX X-ray diffractionmeter. Analytical thin-layer chromatography (TLC) was carried out on Merck 60 F254 precoated silica gel plate (0.2 mm thickness).

II. General procedure

a) General procedure for the synthesis of indole derivatives **1** (**1a** as an example).

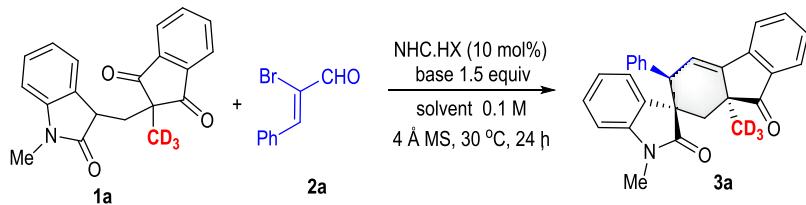

Step A: Aldehyde **S1**^[1, 2] (1.05 equiv.) and 1,3-indandione **S2** (10 mmol, 1.0 equiv.) were dissolved in 100 mL ethanol. The reaction mixture was stirred at reflux temperature for about 6 hours, at which time the condensation product precipitates from the reaction mixture. Removing the solvent through decompression filtration, the yellow solid product was obtained in almost equivalent yield which was used directly in the next step. Condensation product (5 mmol, 1.0 equiv) and Hantzsch ester (1.0 equiv) were dissolved in 50 mL CHCl₃ and the mixture was stirred at reflux temperature for about 12 hours, after the complete conversion of starting material, the reaction mixture was concentrated *in vacuo* to afford a yellow solid. Crystallization of solids from EtOAc/PE to remove reduction of the product, given substrate **S3** as pale yellow solids in excellent yield (two steps, >80% yield).

Step B: To a solution of substrate **S3** (5.0 mmol, 1.0 equiv) in 1,4-dioxane was added Bu₄NOH (40% in H₂O, 1.2 equiv). After the mixture was stirred at room temperature for 30 min, CD₃I (1.05 equiv) was slowly added and the solution was stirred for further 12 h at room temperature. When the reaction is complete, the mixture was poured into aqueous NH₄Cl solution, and diluted with EtOAc. The organic layer was washed with brine, dried over Na₂SO₄, filtered and concentrated. The residue was purified by column chromatography on silica gel to afford the desired fluorination product **S4** as a yellow solid.

A solution of PIFA (3.6 mmol, 1.2 equiv) in CH₂Cl₂ (5 mL) was added dropwise to the reaction mixture of **S4** (3.0 mmol, 1.0 equiv) and Bu₄NCl (3.6 mmol, 1.2 equiv) in 20 mL CH₂Cl₂ at -30 °C. The reaction was completed in ten minutes, upon which time the mixture was poured into water, and extracted with CH₂Cl₂. The organic layer was washed with brine, dried over Na₂SO₄, filtered and concentrated. The residue was purified by column chromatography on silica gel using DCM/PE (4:1-1:0) as eluent to

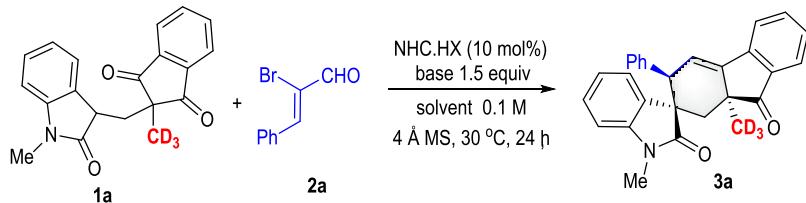

afford the desired product as a white solid.

b) General procedure for the synthesis of product 3. (3a as an example).

To an oven-dried screw-capped test tube equipped with a magnetic stirring bar the triazolium salt **NHC C** (4.2 mg, 10 mol %), NaOAc (12.0 mg, 0.15 mmol), anhydrous 4Å MS (100 mg), **2a** (0.12 mmol, 1.2 equiv) and **1a** (0.10 mmol, 1.0 equiv) were added. To this mixture was added anhydrous mesitylene (1.0 mL, 0.1M). The resultant reaction mixture was kept stirring at room temperature for 24 h. Then the reaction was added to 100 mg silica gel and was kept stirring at 70 °C for 10 h. When the reaction is complete, the crude residue was purified by flash column chromatography on silica gel using PE/EtOAc (3:1) as eluent to afford the desired product **3**.

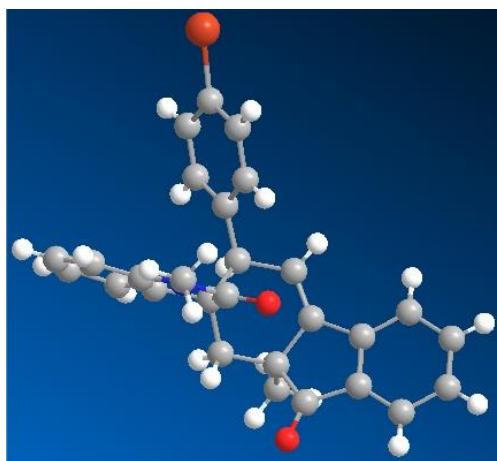

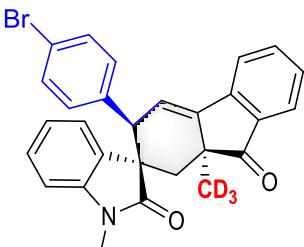

c) Experimental procedure for the scale-up reaction.

A dry 25 mL Schlenk tube equipped with a magnetic stirring bar was successively charged with **1a** (1.0 g, 3.1 mmol), **NHC C** (127.1 mg, 0.31 mmol), NaOAc (372 mg, 4.7 mmol), anhydrous 4Å MS (500 mg) and **2a** (3.72 mmol). To this mixture was added anhydrous mesitylene (8 mL). The resultant reaction mixture was kept stirring at room temperature for 24 h. Then the reaction was added to 3000 mg silica gel and was kept stirring at 70 °C for 10 h. When the reaction is complete, the crude residue was purified by flash column chromatography on silica gel using PE/EtOAc (3:1) to afford the **3a** as white solid (1230 mg, 97% yield, >20:1 dr and >99% ee).

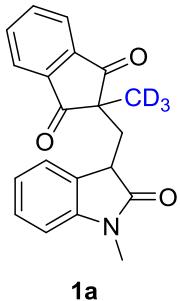

d) Stereochemistry determination **3h** via X-ray crystallographic analysis

Product **3h** was crystallized as a colorless crystal *via* vaporization of a hexane/ethyl acetate solution, and its absolute configuration was determined by *x*-ray structure analysis. CCDC 2027679 contains the supplementary crystallographic data that can be obtained free of charge from The Cambridge Crystallographic Data Centre via www.ccdc.cam.ac.uk/data_request/cif.
